

JavaScript Array & Destructuring Practice Problems

1. Given an array [5, 10, 15], create a copy using slice() and prove it is a new reference.
2. Destructure the first and third element from ['apple', 'banana', 'cherry'].
3. Use rest operator to extract first two values and keep the rest in a new array.
4. Swap two variables using array destructuring.
5. Copy an array using spread operator and modify the copy without affecting the original.
6. Merge two arrays using spread operator.
7. Destructure nested array: [1, [2, 3], 4] to get 2 and 3.
8. Use default values in array destructuring when value is missing.
9. Explain difference between rest operator and spread operator with examples.
10. Remove the last element using pop() and store the returned value.
11. Show why push() returns length and not index.
12. Destructure only the first product name from [['p1', 100], ['p2', 200]].
